GP-26/38F

DRAWER EQUIPMENT

DODDS universal drawer gluer Model GP- 26F/38F glues a range of drawer construction types quickly and neatly. Ideal for custom and long production runs, machine offers labor savings through operation, precision gluing automatic clean-up. Other DODDS machines for drawer assembly include Model C-36LD-B and C-48N universal drawer clamp, which flushes the drawer side tenons to the fronts and backs after glue is applied.

Simplified Operation

Position the moveable head to match the length of the drawer side, and turn the selector switch to (Mode 1) six inches and below or (Mode 2) above six to twelve inches. Place the drawer side on the table bars, which trips the limit switch. The metering pumps are activated, and the precise amount of glue is automatically applied to the tenons on both ends of the drawer side. The drawer sides are then ready for assembly, and no wiping of the assembled parts should be required. Cleaning of the glue system is automatic. Simply turn the valve lever from "glue" to "water," turn the selector switch from "run" to "prime/purge," and pull the start button. Water then cleans the glue system automatically. Reversing the settings automatically primes the system with glue before resuming operation.

Features

- Automatic glue system cleaning.
- No tools required for set up.
- Fast, precise operation.
- Selector switch for different drawer heights.
- Large glue tank capacity.
- Precise metering glue pumps
- Full range of product capability.

Options

- Longer machine length
- Glue fingers for box joints
- Glue fingers for French (sliding) tenon joints
- Glue fingers for rabbeted joints
