

Lean, Efficient & Profitable

Stonewood USA is offering a high-production Return Conveyor System with a multi-direction receiving deck. The system offers three operational options:

- 1 Return all boards to operator
- 2 Kick all boards to right side (none are returned)
- 3 Kick boards to right and left (return side)

Option 3 has revolutionized the complete panel shop flow cycles. It absolutely works great!

For example, one person feeds the rip saw and returning only board that need to be re-ripped. The finish cut boards kick to the right side where the lay up person is stationed. This person, once the panel is layed up, will set panel/boards on the conveyor (on edge). The conveyor then transport the panel/boards thru the glue conveyor and to await placement in the clamp carrier.

This is normally a three-person system, reduce to just two. With our system, there are as little contact with the boards as necessary. Truly a highly efficient system to process and glue up panels!
